                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 8, Application US/09751798

Patent No. 6525177

GENERAL INFORMATION:

APPLICANT: Stockert, Elisabeth, Jager, Elke;

APPLICANT: Chen, Yao-tseng; Scanlan, Matthew;

APPLICANT: Chuth, Alexander; Old, Lloyd J.

TITLE OF INVENTION: Antibodies Which End to NY-ESO-1

TITLE OF INVENTION: Associated Proteins, Uses Thereof,

TITLE OF INVENTION: Truncated Forms of NY-ESO-1, and HLA

TITLE OF INVENTION: Binding Peptides Derived Therefrom

NUMBER OF SEQUENCES: 8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-252-991A-24923

; Sequence 24923, Application US/09252991A
; Sequence 24923, Application US/09252991A
; Patent No. 6551795
; GENERAL INFORMATION:
    APPLICANT: Marc J. Rubenfield et al.
    TITLE OF INVENTION: NUCLEIC CATC AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
; TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
; TITLE OF INVENTION: ABRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
; FILE REFERENCE: 107196,136
; CURRENT APPLICATION NUMBER: US 60/074,788
; PRIOR FILING DATE: 1999-02-18
; PRIOR PLICATION NUMBER: US 60/094,190
; PRIOR PLICATION DATE: 1999-07-27
; NUMBER OF SEQ ID NOS: 33142
; SEQ ID NO 24923
     Sequence 17335, Application US/09252991A

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

This peptide corresponds to amino acid residues 50-62 of human NY ESO-1/CMG-3 ORF1 (see AAYO5965), a new and potent tumour antigen that is expable of eliciting an antigen specific immune response by T cells. Cancer peptides (see AAYO5967-87) derived from CAG-3, portions of CAG-3 and their variants, are useful as cancer vaccines. A claimed method of preventing or inhibiting cancer involves administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, NY ESO-1/CAG-3 gene; CAG-3 gene; cancer peptide; antigen; human; leukaemia; non-Hodgkins lymphoma; Hodgkins lymphoma; lung cancer; metantasis; metanoma; adenocarcinoma; thymoma; colon cancer; uterine cancer; breast cancer; prostate cancer; ovarian cancer; cervical cancer; bladder cancer; kidney cancer; pancreatic cancer; liver cancer; sarcoma; tumour; diagnosis; immunotherapy; therapy; (USSH ) US DEPT HEALTH & HUMAN SERVICES. vaccine; cytotoxic T lymphocyte; CTL. antino acid residues 48-62 of human ESO-1/CAG-3 (or CAG-3) ORF1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), partions of them and their cac catigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2, (see AAY05966), partions of them and their cac variants (see AAY05967-87), are useful as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also cancer peptide animal; antisense oligonuclectides that inhibit expression of the cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, carcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer, and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is created by inducing cancer-specific T cells in vitro for subsequent

409918206-A2 15-APR-1999 WPI; 1999-277270/23.

The present sequence represents a cancer peptide that is based on amino acid residues 44-62 of human ESO-1/CMG-3 (or CMG-3) ORF1 (see AAY05965), a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides derived from CAG-3 ORF1, CAG-3 ORF2 (see AAY05966), portions of them and their variants (see AAY05967-87), are useful, as cancer vaccines that protect against cancer. The invention provides: vectors and host cells (also useful as vaccines); a method of diagnosis of cancer or precancer; a transgenic animal; antibodies reacting with a CAG-3 cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide or tumour antigen; antibodies reacting with a CAG-3 cancer peptide. Continuour antigen; antibodies reacting with a CAG-3 cancer peptide, useful in diagnostic and detection assays; and methods for preventing or inhibiting cancer by administering a cancer peptide, with or without an HLA molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, lymphoma, sarcoma, lung cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, kidney cancer and adenocarcinomas such as breast, prostate, ovarian, pancreatic and thyroid cancers. Melanoma is treated by an antibodies cancer subsequent return to a patient

New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a pathogen or cancer. 

Example 3; Fig 27; 364pp; English.

The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linkage in the parent polypeptide to impede, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides and polymucleotide encoding and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymucleotides are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breast, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, coesophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against viral (such as infections caused by HIV (human immunodeficiency virus), hepatitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, Salmonella, Streptococcal, Legionella and Mycobacterium or parasitic (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence a peptide derived from a parent protein used to construct a savine of invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method of identifying a polypeptide suitable for epitope liberation, including the steps of identifying an epitope of interest; providing substrate polypeptide sequence including the epitope, wherein the substrate permits processing by a proteasome; contacting the substrate with a composition including the proteasome; and assaying for liberation of epitope. The invention may be useful for the development of compounds with a cytostatic, antibacterial, protocacide or fungicide activity acting as r-cell activators. In addition, the invention may allow development of a vaccine. The invention addition, the invention may allow development of a vaccine. The invention is useful for identifying a polypeptide suitable for epitope liberation, where the epitope is a housekeeping epitope. The compositions comprising the identified housekeeping epitopes are useful in vitro in vaccine development or in the generation or expansion of cytotoxic T lymphocyte (CTL) to be used in adoptive immunotherapy. The invention is also useful for activating T-cells against neoplastic cells, and cells infected with vitra, bacterium, protozoan or fungus. CTL epitopes are identified based not the knowledge that such epitopes are, in fact, produced by the housekeeping proteasome system. Once identified, these epitopes, embodied as pertices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   epitope liberation; substrate; proteasome; cytostatic; antibacterial; protozoacide; fungicide; T-cell activator; vaccine; housekeeping epitope; cytotoxic T lymphocyte; CTL; adoptive immunotherapy, neoplastic cell; virus; bacterium; protozoan; fungus; housekeeping proteasome system;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          responses against housekeeping protéasome expressing target cells in host. The present sequence is that of a protein which is related to method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying polypeptide suitable for epitope e.g., housekeeping epitope, liberation by contacting substrate polypeptide comprising epitope of interest, with proteasome, and assaying for liberation of epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a cancer associated antigen. The clone from which the DNA sequence is obtained is designated NY-ESO-1. The specification described a method for determining regression, progression of onset of a cancerous condition, comprising monitoring a sample from a patient with the cancerous condition for a parameter selected from NY-ESO-1 protein, a peptide derived from NY-ESO-1 protein and cytolytic T cells specific for the peptide and an MHC molecule with which it non-covalently complexes. Methods for the treatment of a cancerous condition are also described. The NY-ESO-1 protein and peptides derived from it can be used for diagnosis and treatment of cancers and to monitor the efficacy of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated cancer associated antigen - is used to develop products for the diagnosis and treatment of cancers and for monitoring cancer therapy.

The present sequence represents human NY-ESO-1, formerly known as LL-1.2 clone, which is used in an example from the present invention which describes LAGE-1 tumour associated protein (TAP). The present invention also describes: (1) a method for treating a subject with a disorder characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering to the subject autologous cytolytic T cells to ameliorate the disorder, where the cytolytic T cells are specific for complexes of an HLA molecule and a LAGE-1 TAP or an immunogenic fragment (2) a method for treating a subject with a disorder characterised by expression of a LAGE-1 nucleic acid molecule or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an expression product, comprising administering a LAGE-1 TAP or an especific for a LAGE-1 TAP comprising contacting an isolated population of T cells with cytolytic T cells specific for a LAGE-1 TAP comprising contacting an isolated population of T cells with the cytolytic T cells immunogenic fragment and a HLA presenting molecule to selectively enrich the isolated population of T cells with the cytolytic T cells. The methods and products from the present invention can be used for the methods and products from the present invention can be used for the methods and products from the present invention can be used for the methods and products from the present invention can be used for the methods and products from the present invention can be used for the present and a HLA present invention can be used for the products from the present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present and a HLA present invention can be used for the present

The present sequence represents the ORF1 protein encoded by open reading frame 1 of the human ESO-1/CAG-3 (or CAG-3) gene. CAG-3 is a new and potent tumour antigen capable of eliciting an antigen specific immune response by T cells. Cancer peptides comprising ORF1, ORF2 (see AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides and their variants (see AAY05965-CC AAY05966), portions of these peptides that invention provides: vectors and host cells development of cancer. The invention provides: vectors and host cells catransgenic animal; antisense oligonucleotides that inhibit expression of the cancer peptide, useful in diagnostic and detection assays; and methods concer peptide, useful in diagnostic and detection assays; and methods concer peptide, useful in diagnostic and detection assays; and methods controlly an inhibiting cancer by administering a cancer peptide, with or without an Hib Molecule. The cancer peptides form part of, or are derived from, cancers such as primary or metastatic melanoma, thymoma, cancers bladder cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer, leukaemia, uterine cancer, cervical cancer, bladder cancer, liver cancer, and adenocarcinomas such as breast, prostate, ovarian, pancaetic and thyroid cancers. Malanoma is treated by inducing cancer specific T cells in vitro for subsequent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This protein is derived from open reading frame (ORF)—I that contain epitopes of tumour specific T-cells. NY-ESO-1 is expressed in different tumour types, but not in healthy tissues except in testis. It also shows homology with the CAMEL (Cytotoxic T lymphocytes (CTL)—recognised Antigen on MELanoma) protein, a tumour-associated antigen. The tumour-associated antigen on displayed on melanoma cells is recognised by cytotoxic T lymphocytes. This sequence has anticancer activity. CAMEL tumour antigen and immunogenic peptides derived from it are useful for cancer immunotherapy. They have the potential to induce an immune response, by eliciting a CTL response. The DNA molecule is used for the construction of recombinant or

This sequence represents a human oesophageal cancer-associated antigen, NY-ESO-1. The cDNA encoding this sequence was isolated from a cDNA encoding this sequence was isolated from a cDNA carry prepared from a specimen of well-to-moderately differentiated grammous cell cancer of the oesophagus. Expression analysis demonstrated that NY-ESO-1 was expressed in oesophageal carcinoma, certain melanoma cell lines and in normal ovary and testis tissue, but not in normal colon, kidney, liver or brain tissue. Analysis of the amino acid sequence of the protein indicates that the protein has a transmembrane domain, several N-myristoylation sites and O-phosphorylation sites and that it contains antigenic sequences in the N-terminal half of the protein. The artigen is useful as an immunogen when combined with an adjuvant, in both protein and post- translationally modified forms, and may be used to generate anti-NY-ESO-1 antibodies. It can also be used as a diagnostic marker for oesophageal cancer, and can be utilised as a marker for the targetted delivery of therapeutic agents to oesophageal cancer cells. It

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents cancer testis tumour antigen NY-ESO-1 (also called LAGE-2). NY-ESO-1 is a molecule that is processed to at least one human leukcoyte antigen (HLA) binding peptide, which binds to class I and Class II major histocompatibility complex (MHC). NY-ESO-1 is expressed in tumour mRNA and in testis, but not normal colon, kidney, liver or brain tissue. The presence or level of expression of NY-ESO-1 may be assayed for the diagnosis of cancer, especially testis tumours

It is provided in a specification relating to a method for determining the status of a cancerous condition in a patient with a tumour that expresses NY-ESO-1. The method comprises assaying a sample taken from the patient for antibodies that specifically bind to the NY-ESO-1 and comparing the value obtained to a prior value obtained from assay of a prior sample taken from the patient. Any difference between the values is indicative of a change in status of the cancerous condition. The method is useful for determining wheher a cancerous condition is progressing, regressing or remaining stable, in particular in patients receiving treatment for a melanoma, adenocarcinoma, non-small cell lung carcinoma or bladder

The sequence represents a human NY-ESO-1 tumour rejection antigen

precursor. NY-ESO-1 and SSX-2 polypeptides, or fragments of, bind to

major histocompatibility complex (MHC) Class II molecules such as human
leukocyte antigen-determining region (HLA-DR) molecules and stimulate

proliferation of helper T cells. The peptides can be administered to an
HLA-DR positive subject in order to stimulate the helper T cells. An MHC
Class II HLA-DR-NY-ESO-1/SSX-2 complex expressed on the surface of a cell
or present in free form is useful for this stimulation. The nucleic acid
is useful for screening for a cancerous condition, which involves
contacting a subject sample to a cell line transfected with the
immunoreactive cell (helper T cell), where interaction is indicative of
cancer. In addition, a sample from a patient (for example, a body fluid
or tissue) can be monitored for the amount of the complex present in the
bloodstream. This is useful for determining regression, progression or
onset of a cancerous condition. The method involves contacting the sample
with a radioactive labelled or enzyme labelled monoclonal antibody which
specifically binds with the complex

"Isolation and primary structure of chicken PACAP.";
Regul. Pept. 37:326-326(1992).
-!- FUNCTION: Primary role of GRP is to release GH from the pituitary.
-!- FUNCTION: PACAP plays pivotal roles as a neurotransmitter and/or a neuromodulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
